

Employee Attrition Analysis

This study was conducted to understand why employees leave the company and to identify the groups that may require additional attention from the HR team.

The analysis shows that the company's overall employee attrition rate is **16.12%**, which means that approximately **one out of every six employees leaves the organization**. The highest employee turnover is seen in the **Sales department**, followed by **Human Resources**.

Among different job roles, **Sales Representatives** have the highest attrition rate, with nearly **40% of employees leaving the company**. Laboratory Technicians also show higher-than-average turnover. These groups should be considered high-priority for retention efforts.

The study also indicates that employees with **lower salaries, more overtime, and fewer years at the company** are more likely to leave. However, salary is not the only reason behind attrition. Factors such as **work-life balance, job satisfaction, and career growth opportunities** also play an important role in employee retention.

Based on these findings, two key recommendations are suggested:

1. Introduce targeted retention programs for employees in the Sales department, especially Sales Representatives and new employees in their first few years of service.
2. Improve employee engagement by reducing excessive overtime, promoting work-life balance, and conducting regular career discussions and stay interviews.

This analysis can help HR identify employees who may be at risk of leaving and take preventive actions early. However, the results should be used as a support tool rather than a final decision-making system, since personal factors such as family situations, better external opportunities, or individual career goals cannot be fully captured by the data.
